security quotient®

How to prevent AitM attacks?

Monitor network traffic anomalies

Deploy advanced intrusion detection systems and intrusion prevention systems to monitor network traffic for unusual patterns and to prevent data interception.

2

Implement end-to-end encryption

Use end-to-end encryption for all communications to ensure that even if data is intercepted, it cannot be read or altered by attackers.

3

Enable automatic attack disruption

Use automatic attack disruption tools to isolate compromised assets. These tools rapidly isolate compromised devices and cut off attacker access, minimizing the impact of an AitM attack.
